Abstract (en)

The invention foresees on the skin a water repellent tanning which excludes the possibility of sorption inks on both sides of the skin coat. Then it is attuated the transfer phase of the inks, which form the drawing, from the sublimatic paper on the printing part acting with pressure and hot by means of transfer devices or other. The sublimatic inks initially penetrate into the tanned support, thus determines a new type of integrated printing which allows the drawing to during in the time and allows the inks penetration. This enables to avoid the degrading of the image even in case of abrasions.
