Abstract (en)

[origin: EP0428961A1] The new floor socket for receiving a post of a sports apparatus is to be usable for a multiplicity of different post cross-sections. For this purpose, provision is made for the inside circumference of the floor socket (1) to be partially of polygonal construction and for an intermediate wall (6) to be provided opposite the polygonal side (5), which wall can be inserted into the floor socket (1) with variable spacing from said polygonal side. Due to the variable insertion of the intermediate wall (6) and the polygonal construction, posts can be used which differ both in size and in cross-section, but which always come to rest inside the floor socket in such a way that a secure support of the post is guaranteed.
