Abstract (en)

[origin: EP0430084A1] In a device for transferring patients, comprising a movable frame (10) mounted on rollers (16), a platform (20) arranged unsupported on the frame, and a conveyor belt (44) which, covering the upper side (34) and the underside (38) of the platform (20) at least partially, is guided around the free longitudinal edge (36) of the platform (20) near the patient and can be displaced by means of a drive device (30) in both directions, the conveyor belt (44), starting from a first take-up roller (26) mounted in the frame (10), is guided over the upper side (34) of the platform (20) about the free longitudinal edge (36) thereof, along the underside (38) of the platform, about a second take-up roller (28) mounted in the frame (10), to a deflecting edge (40) arranged near the free longitudinal edge (36) of the platform (20) and under the latter, and around the deflecting edge towards the second take-up roller (28), the ends of the belt running onto the take-up rollers (26, 28) in such a way that these in each case turn in the same direction during winding on and winding off. <IMAGE>
