Abstract (en)

[origin: EP0430396A1] An apparatus for cutting and shaping a spherical body of a sticky material, comprising an assembly consisting of a number of rotary members (10) for collectively forming an enclosure at the center thereof to cut and shape the material passing through the enclosure. Each of the members has curved side surfaces (Y1, Y2) such that the enclosure is confined through the exposed part of one set of curved side surfaces of the members which pivotally swing to open and close the enclosure. The tip of each of the members follows the exposed curved side surface of the adjacent member to scrape off the material adhering thereto, and each of the members has a uniform thickness that is thick enough to preclude the member from wedging into the material and that decreases towards the tip thereof, so that substantially spherical products can be continuously produced without generating any difficulty caused by the material adhering to the cutting members or by the filling protruding through the coating even when processing very sticky, soft materials. <IMAGE>
