Abstract (en)

[origin: EP0430732A1] The invention relates to a mechanism for the external control of the opening of a motor-vehicle door. This mechanism comprises a movable element (5) which can pivot in a housing (2), but which, in the position of rest, is in the exact extension of the vehicle body. The element (5), during its pivoting, actuates a microcontact which controls the electrical opening of the lock (16). The element (5) can control the opening of the lock (16) by means of an emergency mechanical connection (20, 21, 22, 24, 25, 17). The emergency mechanical connection is disengaged either by a fork (29), operated by the barrel of the lock, or by an electrical actuator (31). <IMAGE>
