Abstract (en)

[origin: EP0430764A1] Container comprising a closure device comprising a first member, consisting of a round body, in particular a sphere (15), mounted on a rod (16) fixed on the lid, and a second member, comprising a ramp (17) and two flexible guides (18, 18'), preferably diverging in the direction of rise of the ramp, this second member being integral with a push-button (19) which can be operated from outside the container. By displacing the push-button (19), the second member of the closure device is displaced, which forces the sphere (15) to rise over the ramp (17) and to be displaced between the flexible guides (18, 18') until it is ejected; the container is then partly open. <IMAGE>
