Abstract (en)
[origin: EP0430925A2] A device for the camouflage of military objects, for example a gun having a lower mount 1, an upper mount 2, jibs 3 and two gun barrels 5, possesses a frame which consists of arms 6, 7 and 8. The arms 6, 7 and 8 are connected to one another by means of plug or screw connections. The frame carries a camouflage net 18. So that the camouflaged object has an irregular appearance, hence the camouflaging effect is especially high, the frame consists of arms 6, 7 and 8 which are of variously irregular shape. The frame and therefore the camouflage have different heights on the two sides L, R of the longitudinal axis of the object. <IMAGE>
