Abstract (en)

[origin: WO9100412A1] A by-pass valve for a boring column comprises a hollow casing (1) with lateral openings (2), a saddle (4) constituted by the internal surface of the casing (1) and a closing element consisting of an elastic, resilient sleeve (3) secured by one of its ends in the casing (1). The sleeve (3) is mounted with a gap (6) and is provided with a confusor (7). The valve may be provided with a jacket (8) or with shutters. The absence of moving parts, better sealing of the channel for the flow of the liquid, and decreased hydraulic resistance of the valve lead to a reduced wear and destruction of its parts and increases the reliability and longevity of the valve.
