Abstract (en)
[origin: EP0431461A2] A switch mechanism for an electrical switching device, especially in a signalling switch, having at least one fixed-position contact piece and one moving contact piece, which is arranged on the free end of a contact finger that is connected to a pivoting part which can be pivoted about a pivoting axis as a result of being acted on by an actuating lever, the actuating lever (18) engaging on the pivoting part (20) at a radial distance from the pivoting axis (32) and the actuating force transmitted by the actuating lever (18) to the pivoting part (20) being variable as a function of the force. <IMAGE>
