Abstract (en)
[origin: EP0431798A2] A method of making labels for application to a product comprises assembling a backing web and a label web. The backing web is passed through a release material application station and a curing station for the release material, prior to assembly with the label web, and in the same machine. This enables pre-printing of the backing web so that portions of it can be used to display information or other matter instead of being wasted. Also, by treating both sides of the backing web, a label web can be applied to both sides of it, thereby enhancing economy of costs and materials.
