Abstract (en)
[origin: EP0432448A1] In a process for making a slotted screen, which is suitable especially for use in plants for the sorting or cleaning treatment of aqueous suspensions of fibre material, for example in paper manufacture, longitudinal bodies (1) in the form of wire or rods and bounding the screen slots are fitted to transverse bars (2). To reduce the risk of catching and hence flocking and/or spinning of the fibres present in the suspension on the slotted screen as far as possible in the later operation of the screen, the joints (3) between the longitudinal bodies (1) and the transverse bars (2) are provided on their free surfaces with covers (4) which have a smooth outside and consist of a solder or another smooth-flowing, solidifying material.
