Abstract (en)  
[origin: EP0432477A1] A device for clamping a strip about an object has a clamping member, the aim being to limit the tension to be transferred from the clamping member to the strip to a predetermined value. This is achieved when the clamping member (4) is set up to slide through on the strip (2, 6) to be tensioned when the predetermined strip tension is reached. The clamping member can have projections which penetrate into the surface of the strip and are designed to remove or displace material during the sliding through. The clamping member is preferably formed by a tension pulley. <IMAGE>
