Abstract (en)

[origin: EP0432628A1] The process, by means of which the durability of refractory linings in vessels, which contain inclined regions or conical parts in the inner contour, is controlled, comprises oblique laying of the refractory bricks, following the inner contour of the vessel. The inclined position of the bricks is accomplished stepwise by means of a plurality of layers of deflection bricks suitable for machine pressing and having a known, uniform density. By means of this process, softer transitions from horizontal to oblique brick laying can be achieved. <IMAGE>
