Abstract (en)  
[origin: EP0432675A2] For an apparatus for handling coins or suchlike disc-shaped objects, the individual functional elements, such as, for example, a counting and/or a stacking and/or a packaging device, being capable of working as intended only after mechanical settings executed as a function of specific parameters or their number, it is proposed that respective separately controllable and continuously adjustable setting means are provided for the settings corresponding to the parameters or to the number of coins of a particular coin collection. In particular, the setting means are assigned a central control unit, via which the particular settings corresponding to a specific parameter are initiated. This affords a "coin treatment device", by means of which any settings of the functional elements are (can be) executed continuously and simultaneously. <IMAGE>
