Abstract (en)
[origin: EP0433236A1] The supporting construction consists of longitudinal profiles and/or transverse profiles (8), which have an upwardly open channel situated below the coverings (33, 34), in order to carry water (10; 11) which has penetrated downwards through the seals (71) away from the covered zone towards the outside. In this arrangement, the transverse profiles (8) can reach through a recess into the longitudinal profiles, or vice versa. The supporting construction is intended for holding roof-covering slabs, penthouses, skylights, canopies, sloping glazing and similar coverings. <IMAGE>
