Abstract (en)

[origin: EP0434635A1] The present invention relates to a manually or automatically operated lock, for closures in general and in particular for rolling gates, characterized in that said lock comprises, inside a holding body (1), an electric motor driving, through a gear chain (3), a side rod pair. Moreover, a key cylinder is provided which cooperates with a middle element of the gear chain (3) for disengaging, as a key is operated, the kinematic coupling with the driving electric motor (2) in order to cause a movable body (1) arranged between the two elements forming the middle element, to translate. <IMAGE>
