Abstract (en)

[origin: EP0435040A1] The invention relates to a fitting plate for a hinge, consisting of a baseplate and of an intermediate plate which is adjustable relative to this and which can be braced with or connected to the baseplate in different set positions by means of a screw or the like and on which the hinge arm is held preferably adjustably. To provide a fitting plate of this type, by means of which hinges of conventional design can be fastened to supporting walls of furniture in such a way that the doors articulated by means of them assume, in the closed position, an angle to the supporting wall differing from 90 DEG , the baseplate (5, 25) and the intermediate plate (3, 26) are supported on one another via complementarily cylindrically curved faces (5, 6, 27, 28), the axes of curvature of which extend transversely relative to the plates, so that the plates are set, in a common mid-plane approximately at right angles to them, at different angles formed by these and can be braced with one another or fixed to one another in freely selectable set angular positions. <IMAGE>
