Abstract (en)
[origin: EP0436919A2] The invention relates to a guiding device for pressing printing carriers transported in a printing apparatus against a printing carrier rest, comprising one or more guiding units which consist of a guiding surface arrangement (24) and assigned guiding rollers (10) and are connected via adjustment levers to a common rotary shaft (20). In this case, the adjustment levers are constructed directly as guiding roller supports (18) and the guiding surface arrangements (24) as separate guiding surface elements which can be attached removably to the guiding roller supports. The guiding surface elements are preferably produced as inexpensive plastic parts. Arranged on each guiding surface element (24) are one or more sprung catch hooks (38, 40) which can be engaged behind catch surfaces constructed on the guiding roller support (18). <IMAGE>
