Abstract (en)

The invention relates to the technical field of electronic teleconference apparatus and in particular to a radio-frequency apparatus for voting teleinformation, in which a number of terminals (1-6) is connected through radio ducts with a receiving unit (7) of a frequency-synthesis type which scans all channels, identifies the transmitting terminal (1-6) and the voting associated therewith and sends the latter, suitably demodulated and curtailed of non-information contents, to a processor (8) which carries out the data decoding and processing. <IMAGE>
