Abstract (en)
[origin: EP0439716A1] 2.1. Such anchors (1) generally possess a strip (2) in the shape of a flat rectangle in cross-section and having holes (3) arranged at a distance one behind the other in the longitudinal direction, a bolt (14) for connecting the strip (2) to a holding element anchored in the facade plate (7) being inserted through one of the holes (3). At the upper end, the strip (2) is connected to an attachment part. Compensation of a horizontal offset between facade plates and attachment elements is not possible. <??>2.2. The holding element comprises at least one supporting part (5), preferably in the form of an angle piece having a horizontal and vertical leg (5', 5''), and a counterpiece (6) running parallel to the vertical leg. Both parts between which the strip (2) is passed are, at least over part of their length, at a distance (a) from one another which is at least as great as the thickness of the strip (2). The strip (2) is bent directly above the angle piece (5), the angle piece serving as bending edge. <??>2.3. Attaching facade plates on a wall of a building or the like. <IMAGE>
