Abstract (en)

[origin: EP0439721A2] The device (16) for lateral inclination of the shaft (12) with respect to the shell of the boot (10) has an adjustment disc (18) with an eccentric part (22) formed on. The adjustment disc (18) is mounted on the shell of the boot (10) and engages with its eccentric part (22) in a slot arranged in the shaft part (14) and extending in the longitudinal direction of the boot. By turning the adjustment disc (18), the shaft part (14) is raised on one side and the shaft (12) thus inclined. In order to achieve a rectilinear movement of the shaft part (14) during raising, means are present for the longitudinal guidance of the shaft part (14) relative to the shell of the boot (10). The eccentric part (22) can give way laterally in said slot, i.e. in the longitudinal direction of the boot. <IMAGE>
