Abstract (en)

[origin: EP0439808A1] A device for transporting patients is described, which can be opened in a reclosable manner by means of a partition along its longitudinal direction and a guide channel running along this partition, even when a patient is lying on the device, and/or which has in the crotch area additional shaped elements for the stable positioning of the legs. The device can be taken up by a carrier, facilitating the transporting of a patient. The device can be designed as a carrying sheet or bed-transfer sheet, as a support for a stretcher, as a support mattress or even as a vacuum mattress. <IMAGE>
