Abstract (en)

[origin: EP0439823A1] A package for protecting electronic devices (3) from damage during transport is described which consists of a transport container (4) and hollow profile-type packaging elements (23) which can be fitted onto the device (3) to be packaged. Due to special shaping of the packaging elements, it is possible to make them from a chemical pulp material which is not very stable itself and guarantees a completely unproblematic disposal of the used packaging elements since the material is both inflammable and decomposable. Additionally, the special shaping allows the individual packaging elements to be nested, as a result of which they can be stored and transported in a particularly space-saving manner.
