Abstract (en)  
[origin: EP0439830A2] A device for the handling and processing of a material web (10), which is guided from a supply region over a driven drum (11) forming a processing surface, has a receiving device (30) for the web material which is lower than the drum (11). The receiving device (30) forms a supporting region which extends parallel to the drum (11) and which has at least one surface which moves perpendicularly relative to the axis of rotation (11') of the drum (11), comes into contact with the part of the material web (10) running off from the drum (11) and takes up this part. A stationary deflecting surface (32) is arranged above the supporting region at a distance from the point of impact of the material web (10) with said region in the direction of movement. <IMAGE>
