Abstract (en)

[origin: EP0439865A1] Process for preparing normally liquid hydrocarbons from a hydrocarbonaceous feedstock comprising olefins containing 2-6 carbon atoms, which process comprises passing the feedstock upwardly at elevated pressure and at a temperature of from 150 to 295 DEG C through a reactor containing catalyst particles comprising crystalline support, which catalyst particles stay in the reactor for at least 1 hour at reaction conditions.
