Abstract (en)

There are presented a mesh fabric for screen printing, which is a mesh fabric obtained by use of core-sheath composite filaments in which a component with lower melting point than the core is employed, characterized in that warp and weft threads are adhered to each other at the intersecting points of warp and weft threads by melting of the sheath component after fabrication to cover its surface integrally with the sheath components of the warp and weft threads, whereby the intersecting points of warp and weft threads are integrated on the surface with the warp and weft threads, a process for preparing a mesh fabric for screen printing and a photosensitive film for screen printing plate. <IMAGE>
