Abstract (en)
[origin: EP0440067A1] The grids of slats which serve to receive the mattresses are supported by mountings on the two sides 1 of the bed and a central partition 13. The sides 1 of the bed and the foot part 2 are fixed, with the interposition of spacers 3, to a bed base 5, at a distance above the alignment of the base plate which serves as the bottom closure. The spacers 3 are screwed on from the inside of the bed base, each spacer having a projection designed to support a side 1 of the bed or the foot part 2. As a result of the design according to the invention, it is possible to ventilate the bedstead, the recessed base of the bed simultaneously providing greater freedom for the feet combined with avoidance of visible wear on the covering material in the foot region. <IMAGE>
