Abstract (en)

[origin: EP0440942A2] The invention relates to a method for providing a plurality of information items relating to the operating state of an internal combustion engine, in particular of an internal combustion engine provided with a control unit, with the following steps: - generation of a first item of information having in particular a pulse-duty factor, - generation of at least one further, second periodic item of information which is in particular pulse-shaped, - the information items being combined in a single electrical combination signal. In order to provide the information items in every operation stage, in particular also in thrust mode, it is provided that the pulse widths assigned to the information items are added in each combination signal period. <IMAGE>
