Abstract (en)  
[origin: EP0441357A2] A refrigerated vending cabinet is described which has a shelf structure (1) and a lower merchandise space (2). The lower merchandise space (2) projects forwards relative to the shelf structure (1). According to the invention, an air conducting wall (5) is arranged along the front edge of the lower merchandise space (2), which air conducting wall is aligned essentially vertically in an operating position and can be moved downwards into a loading position (dot-dashed illustration). This can be implemented by a swivelling operation (arrow 10a) about a horizontal axis of rotation (8) or by a displacement operation in the vertical direction (arrow 10b) or even in the horizontal direction.
