Abstract (en)

[origin: EP0441674A1] The process for aluminising a sheet of magnetic steel with oriented grains which has been subjected to at least one cold rolling, at least one intermediate annealing under hydrogen atmosphere, followed by a decarbonising annealing, the grains of the sheet being then in the primary recrystallisation state, is characterised in that a deposition of aluminium is carried out on the said sheet between two stages of a final annealing, the first stage of which produces a partial or total secondary recrystallisation of the grains of the sheet and the second stage of which allows the aluminium to diffuse and the impurities to be removed. <IMAGE>
