Abstract (en)

A mounting and dispensing apparatus (10) is provided for cylindrical package (P) of wound flexible plastic bags (B) or the like which are serially joined to each other along transverse severance lines. A dispensing nozzle (12) has at least one dispensing slot (14) extending therethrough for receiving the leading bag of a package of bags and for resisting free movement of bags being pulled therethrough to facilitate severance of each consecutive bag from an immediately following bag joined thereto along the severance line. A sturdy rack (30) includes a portion (31) for carrying the nozzle (12) in a position to define a first plane, a bag package mounting portion (33) including at least one leg (33 min) defining a second plane extending in a direction parallel to and spaced from the first plane and being configured to removably receive and mount at least one package (P) of wound bags in an optimum position with respect to and at an optimum distance from the dispensing slot (14) in the nozzle (12) and a connecting portion (32) extending in a direction between and generally perpendicular to said first and second planes and secured at one end to the nozzle mounting portion (31) and at the other end to the bag package mounting portion (33). Provisions are made for mounting of the apparatus (10) on an upper or lower and inside or outside surface of a counter top, wall, housing or the like in a plurality of positions wherein the bag pack extends generally horizontally or vertically and either upwardly or downwardly or inwardly or outwardly of the surface. <IMAGE>
