Abstract (en)

[origin: EP0442810A1] The subject of the invention is a watertight roofing comprising a supporting element (2), a layer (10) of insulating material placed over this supporting element and a watertight covering (20) covering the layer (10) of insulating material, means (1, 3 to 8) being provided in order to keep these various constituents together, these means comprising a first member (3) connected to the supporting element (2) and a second member (6) secured to the first member from the exterior face of the layer (10) of insulating material. According to the invention, the first member (3) comprises a head (5) and is connected to the supporting element (2) and retained in relation to the latter by means of a rigid plane base plate (1) which is secured to the supporting element (2) over a zone of dimensions substantially greater than those of the said head, and which delimits retention means interacting with this same head.
