Abstract (en)

[origin: EP0443501A2] The subject matter of the invention relates to a radio receiver in the Radio Data System. To enable fast provision of a list of frequencies which are alternatives to a reception frequency located in the RDS transmitter search run, a device is disclosed with which frequencies which have already been tested, whose reception quality has been confirmed and which are stored under the same PI code, e.g. in the program memory of the unit, are transferred directly to the working memory. <IMAGE>
