Abstract (en)  
[origin: EP0443519A2] A device for discharging fluids is provided with a tank for the fluid, a feed device for the fluid which has an outlet duct and with an actuating device for the feed device, the actuating device being actuatable in the axial direction of the tank in order to deliver the fluid through a discharge duct in the actuating device. The outer wall of the tank is provided with a connecting device, which is designed for detachable connection to a corresponding connecting device of a further tank of a further discharge device. Similarly the outer wall of the actuating device is provided with at least one connecting device which is designed for detachable connection to a corresponding connection device of a further actuating device. Suitable devices prevent a relative movement of the two tanks or two actuating devices towards one another in the event of axial actuation. The discharge device can be used both separately and in combination with the further discharge device without the need for separate connecting parts. <IMAGE>
