Abstract (en)

[origin: EP0443595A2] Mine having a specific direction of action, with a first positioning device for the automatic alignment of the mine in a desired position after it has been brought into a predetermined target zone. Where remotely laid mines are concerned, there is the possibility that, depending on the type of terrain, in particular instances they will not assume their intended position or will be overturned as a result of external forces. In view of this, the mine (1) is equipped with at least one further positioning device (6), by means of which it can be aligned anew in the desired position if the desired position is not obtained by means of the first positioning device or after a variation in position. Preferably, at the same time, the first positioning device (4) or the particular preceding one can be separated from the mine (1) before the second positioning device (6) or the particular following one comes into operation. <IMAGE>
