Abstract (en)

[origin: EP0445312A1] Devices are used for laying cables or flexible pipes on a track which have a winding-on device and a drive device for a tension means at the one end of the track and have a cable drum at the other end of the track, a guide being provided between the drive device and the adjacent end of the track. In order to be able reliably to transmit the thrust and tension forces which occur in the tension means during operation even over long tracks, it is proposed that a flexible forced guide for the tension means, which is however resistant to compression and tension, be provided in each case between the winding-on device and the drive device on the one hand, and the drive device and the adjacent region of the end of the track on the other hand. <IMAGE>
