Abstract (en)

[origin: EP0445422A1] The known article recording devices require all the articles to be recorded to be lifted onto the article transport surface. This is cumbersome, in particular in the case of bulky and/or heavy merchandise. The new article recording device is intended to improve the recording of articles, in particular of bulky and/or heavy merchandise. In order to match the article transport surface (14) as precisely as possible to the position of the articles to be registered, the article transport surface (14) is vertically adjustable. The article recording window (32) of a scanning device can also be moved up and down together with or independently of the article transport surface (14) so that a large degree of matching to the size and the weight of the article and to the position of the article identification is possible. <IMAGE>
