Abstract (en)
[origin: EP0445637A1] The invention relates to a device for filling a box-shaped, preferably mobile, large container from above with a bulk material from collecting vessels. The invention is characterised by the combination of a vertical lifting and tipping device (4, 4a, 4b) for the collecting vessel (5) which is installed in the tail part (3) of the large container (2) and operates on the principle of a forklift truck, and a dumping trough (6) which is guided movably in the longitudinal direction of the container along the upper box edge, into which trough the bulk material from the collecting vessel (5) is dumped, whereupon the dumping trough (6) is moved into the desired emptying position on the container. <IMAGE>
