Abstract (en)

[origin: EP0447310A1] The invention concerns a concrete tubular structure. The structure is essentially constituted by hollow main tubes (TP) assembled by solid or hollow secondary tubes (TS), the assembly being provided by cables (C) for pre-stressing the secondary tubes which traverse the main tubes passing through the thickness of the wall of the main tubes without penetrating into the hollows of the main tubes, along passage curves which are compatible with the function of these cables. The invention applies in particular to the building of off-shore structures. <IMAGE>
