Abstract (en)

[origin: EP0449035A1] The invention relates to a combination lock for containers, such as suitcases, briefcases or the like. The combination lock has setting wheels (3) for an opening combination variable from outside the container and a pull knob (2) for opening the combination lock. <??>The invention is intended to achieve an increase in operating reliability, particularly with regard to the undesired or unauthorised adjustment of a set opening combination. <??>For this, there is a coding element (1) which is adjustable from outside the container out of its blocking position, in which it prevents a variation of the combination, into its release position, in which it allows a variation of the opening combination, and vice versa. <IMAGE>
