Abstract (en)

A flat-type transformer comprises a plurality, at least two, of planar coils (12a, 12b, 12c) and a plate-like electric insulator (13) disposed between adjacent two planar coils so as to form a stacked structure of the insulator and the planar coils. This stacked structure are sandwiched between a pair of magnetic members (14a, 14b) disposed on both the sides of the stacked structure with electric insulators (13) being interposed between the magnetic members and outermost planar coils. The planar coils having substantially the same outer diameter in the stacked structure. Each of the planar coils has a spiral structure in a plane. <IMAGE>
