Abstract (en)
[origin: EP0451334A1] The invention relates to a repeating watch having a manually tensionable spring, as a result of the relaxation of which an axle 9 can be driven rotatably out of a tensioned position into a position of rest. A first rack for actuating a first striking work can be driven rotatably by the axle 9. The first striking work can drive a first hammer by which a first gong can be struck. In a first part of the relaxation excursion of the axle 9 from the tensioned position into the position of rest, the first rack and, in the second part of this relaxation excursion, a second rack can be driven rotatably by the axle 9 in order to actuate a second striking work. At the same time, the second rack can actuate a second striking work, by which a second hammer can be driven so as to be capable of striking a second gong. <IMAGE>
