Abstract (en)

The invention relates to a high-frequency filter arrangement which includes at least one filter with variable frequency. Such a filter is of the type comprising a metal housing (1), a resonator body (10) of a dielectric material, two support bodies (11, 12) in a material with low thermal resistance, aligned coaxially with the resonator body and arranged on either side of it, in contact via their inner axially frontal faces with the upper and lower frontal faces of the resonator body (10), and a device for frequency variation including a cylindrical body (15) made of a dielectric material forming a plunger which can move axially in the aligned axial bores (14) passing through the resonator (10) and support (11, 12) bodies. The arrangement is characterised in that the outer diameters of the support bodies (11, 12) are chosen to compensate for the frequency drift coefficient of the resonator body (10), the height of the support bodies being kept substantially constant. The invention can be used for filters with dielectric resonator. <IMAGE>
