Abstract (en)

Installation comprising several receiver points (4), several transmitter points (1) and several relay points (2) each linked to a receiver point, the transmitter points (1) and the relay points (2) being linked to a common BUS line in such a way as to be able to communicate with each other. The transmitter points (1) are provided to transmit signals on the BUS line, each signal comprising a frame formed by at least one identification element and by at least one element defining a command to be executed by the receiver. To each transmitter point is allocated a particular address code to which the identification element corresponds. The relay points are equipped with a logic processing unit comprising memories provided for storing at least one identification element. Attributing the address to the transmitter makes it possible to produce installations exhibiting very great flexibility. The installation can be, for example, a set of blinds or of revolving shutters. <IMAGE>
