Abstract (en)

[origin: EP0453791A1] In a buckle folder with at least two folding points (F1, F2) formed in each case by a folding-roller pair (W1/W2; W2/W3), and a draw-in device which consists of two advance rollers (T1, T2) and which defines the advance speed for the material to be folded, the draw-in device lies in an advance path (4) running past the first folding point (F1). Arranged directed towards the first folding point are two insert supplying devices, a first behind and a second in front of the draw-in device. In order that an insert can be inserted alternatively into the first or into the second fold, the first folding point (F1) is assigned a knife-like deflection member (6) which can be moved towards the first folding point (F1) with simultaneously fold-forming deflection of the material to be folded and individually actuated for each folding process by an electronic control device (21). Directly in front of the folding pocket (25) lying between the first and the second folding point (F2), there is arranged as second deflection member (26) an electromagnetically controllable deflector for the material to be folded, which, after the material to be folded has run into the folding pocket (25), can be moved out of its rest position towards the second folding point (F2) with simultaneously fold-forming deflection of the material to be folded (43, 55). <IMAGE>
