Abstract (en)

[origin: EP0453888A2] A fluorescent lamp (1) is intended to be illuminated by means of a circuit arrangement at 100% brightness in normal operation and at a reduced brightness in dimmed operation. An inductor (4) and a switch (5), which switches in a phase-shifted manner, are provided. In order to permit operation of the lamp (1) without a transformer, even when the mains AC voltage is close to its burning voltage, the switch (5) is switched on and off periodically even in normal operation, so that the inductor (4) generates a voltage pulse (U3, U5) which supplies the necessary lamp voltage (UL) in each case at a moment when the necessary burning voltage of the lamp (1) is greater than the mains AC voltage (U1 or U2). <IMAGE>
