Abstract (en)

[origin: EP0453943A2] The locking device structure includes a polygonal plate (12a) having a counter roller (18) pivoted thereto, the counter roller being arranged above a driven roller (4). An actuation piston (6) is pivoted to an upper corner of the plate (12a), which is also provided at a lower corner with a presser plate (16). Extension of the piston (6) provides traction feeding of cardboard (14) between the rollers (4,18) whereas retraction of the piston releases the traction and further blocks the feed of cardboard (14) due to engagement of presser plate (16) on abutment surface (19).
