Abstract (en)
[origin: EP0453956A2] The lighting device has, arranged in a housing (1), a plurality of juxtaposed mirror optics (3, 4, 5) for in each case one rod-shaped lamp (6). In order to achieve optimum illumination of problem zones on items to be sprayed and items to be painted, mirror optics (3, 4, 5) of different light distribution are inserted inside the housing (1) of the lighting device, and in a manner exchangeable individually with respect to one another in each case in conjunction with the associated lamps (6) together with holders (6a). In addition, the mirror optics (3, 4, 5) can be displaced in the manner of a carriage on lateral rails (7) in the transverse axis of the lamps (6). Such a lighting device having preferably three mirror optics (3, 4, 5) is particularly suitable for use in spraying or painting booths in the painting of motor vehicle bodies. <IMAGE>
