Abstract (en)

[origin: EP0454010A1] In a device for rotational and changing driving of inking and dampening unit rollers of a rotary printing machine, it is envisaged to design this drive in such an articulated manner that the respective roller can be driven positively even in the event of a change of place. In this connection, the drive shaft (16, 18) of the distributing roller (1), which is mounted in lateral frames (7) of the rotary printing machine, has an articulated coupling (17). <IMAGE>
