Abstract (en)

The present invention proposes a convertor for the guided propagation mode of electromagnetic waves, including a transition structure and means of coupling between this structure and a waveguide able to propagate the mode resulting from the mode conversion, and also comprising means of coupling between the transition structure and a waveguide or a source of microwave electromagnetic energy. According to a significant characteristic of the invention, the said transition structure comprises I waveguides (g_1, g_2, \dots, g_I), I being an integer number greater than 1, chosen as a function of the TE_{lm} mode to be converted (m also being an integer number greater than or equal to 1); these I guides being coupled at their two ends, by coupling holes, respectively to a source of microwave electromagnetic energy or to a guide (G_1) in which a TE_{lm} wave of complex structure propagates, on the one hand, and on the other hand to a waveguide (G_2) able to propagate the mode resulting from the conversion. According to another significant characteristic of the invention, the transition structure comprising I waveguides is coupled directly onto the output cavity of a microwave tube; and, according to another characteristic, the said microwave tube is a gyrotron. <IMAGE>
